

OTT Streaming Content Trend Analysis

Netflix catalog snapshot • Python • SQL • Excel

Executive Summary

This project analyzes 8,807 Netflix catalog titles to understand content mix, category patterns, addition trends, ratings and geographic representation. Movies account for 69.6% of records and TV Shows for 30.4%.

OTT STREAMING CONTENT TREND ANALYSIS

Netflix catalog snapshot • EDA & storytelling • 8,807 titles

Dataset & Preparation

The source contains 8,807 records and 12 original columns. There are 0 duplicate rows and 0 duplicate show IDs. Date fields were converted to datetime, duration was split into numeric value and unit, and multi-value genre/country fields were expanded for frequency analysis. Missing values were retained rather than guessed.

Key Findings

Area	Finding
Content mix	Movies 6,131 (69.6%); TV Shows 2,676 (30.4%).
Addition trend	2019: 2,016 titles added.
Top category	International Movies: 2,752 records.
Top country	United States: 3,690 records.
Top rating	TV-MA: 3,207 titles.
Release peak	2018: 1,147 titles.

Actionable Insights

- The catalog is weighted toward Movies (69.6%), so future additions should be evaluated against the existing format mix.
- 2019 is the strongest year for recorded additions in this snapshot, making year-over-year catalog growth useful to monitor.
- International Movies has the highest frequency after category expansion and can serve as a baseline for category trend tracking.
- United States is the most represented country, while multi-country titles mean country counts are not mutually exclusive.
- TV-MA is the dominant rating label and can be used for audience-segmentation reporting.

Recommendations

1. Track Movie/TV Show mix over time rather than total catalog size alone.
2. Monitor both high-frequency and emerging categories to balance depth and variety.
3. Add regional reporting to identify changes and gaps in geographic representation.

Limitations & Next Phase

This is a historical Netflix catalog snapshot. It does not contain views, revenue, subscribers or engagement metrics. The supplied file does not contain Prime Video or Hotstar/Disney+ records, so a genuine multi-platform comparison requires additional verified datasets standardized to the same schema.
